## Background: Bipolar Disorder and the HCA Animal Model

- It is becoming increasingly apparent that symptoms of and comorbidities associated with bipolar disorder can vary between men and women.
- Recent research has shown that men diagnosed with bipolar disorder are more likely to exhibit alcohol use disorders and obsessive compulsive behaviors while women have a higher incidence of panic disorder.
- Homocysteic Acid (HCA) is a glutamate analog that has been demonstrated to induce a mixed manic/depressive state in rats when administered during a critical phase in development (P3-P21).

## Hypothesis

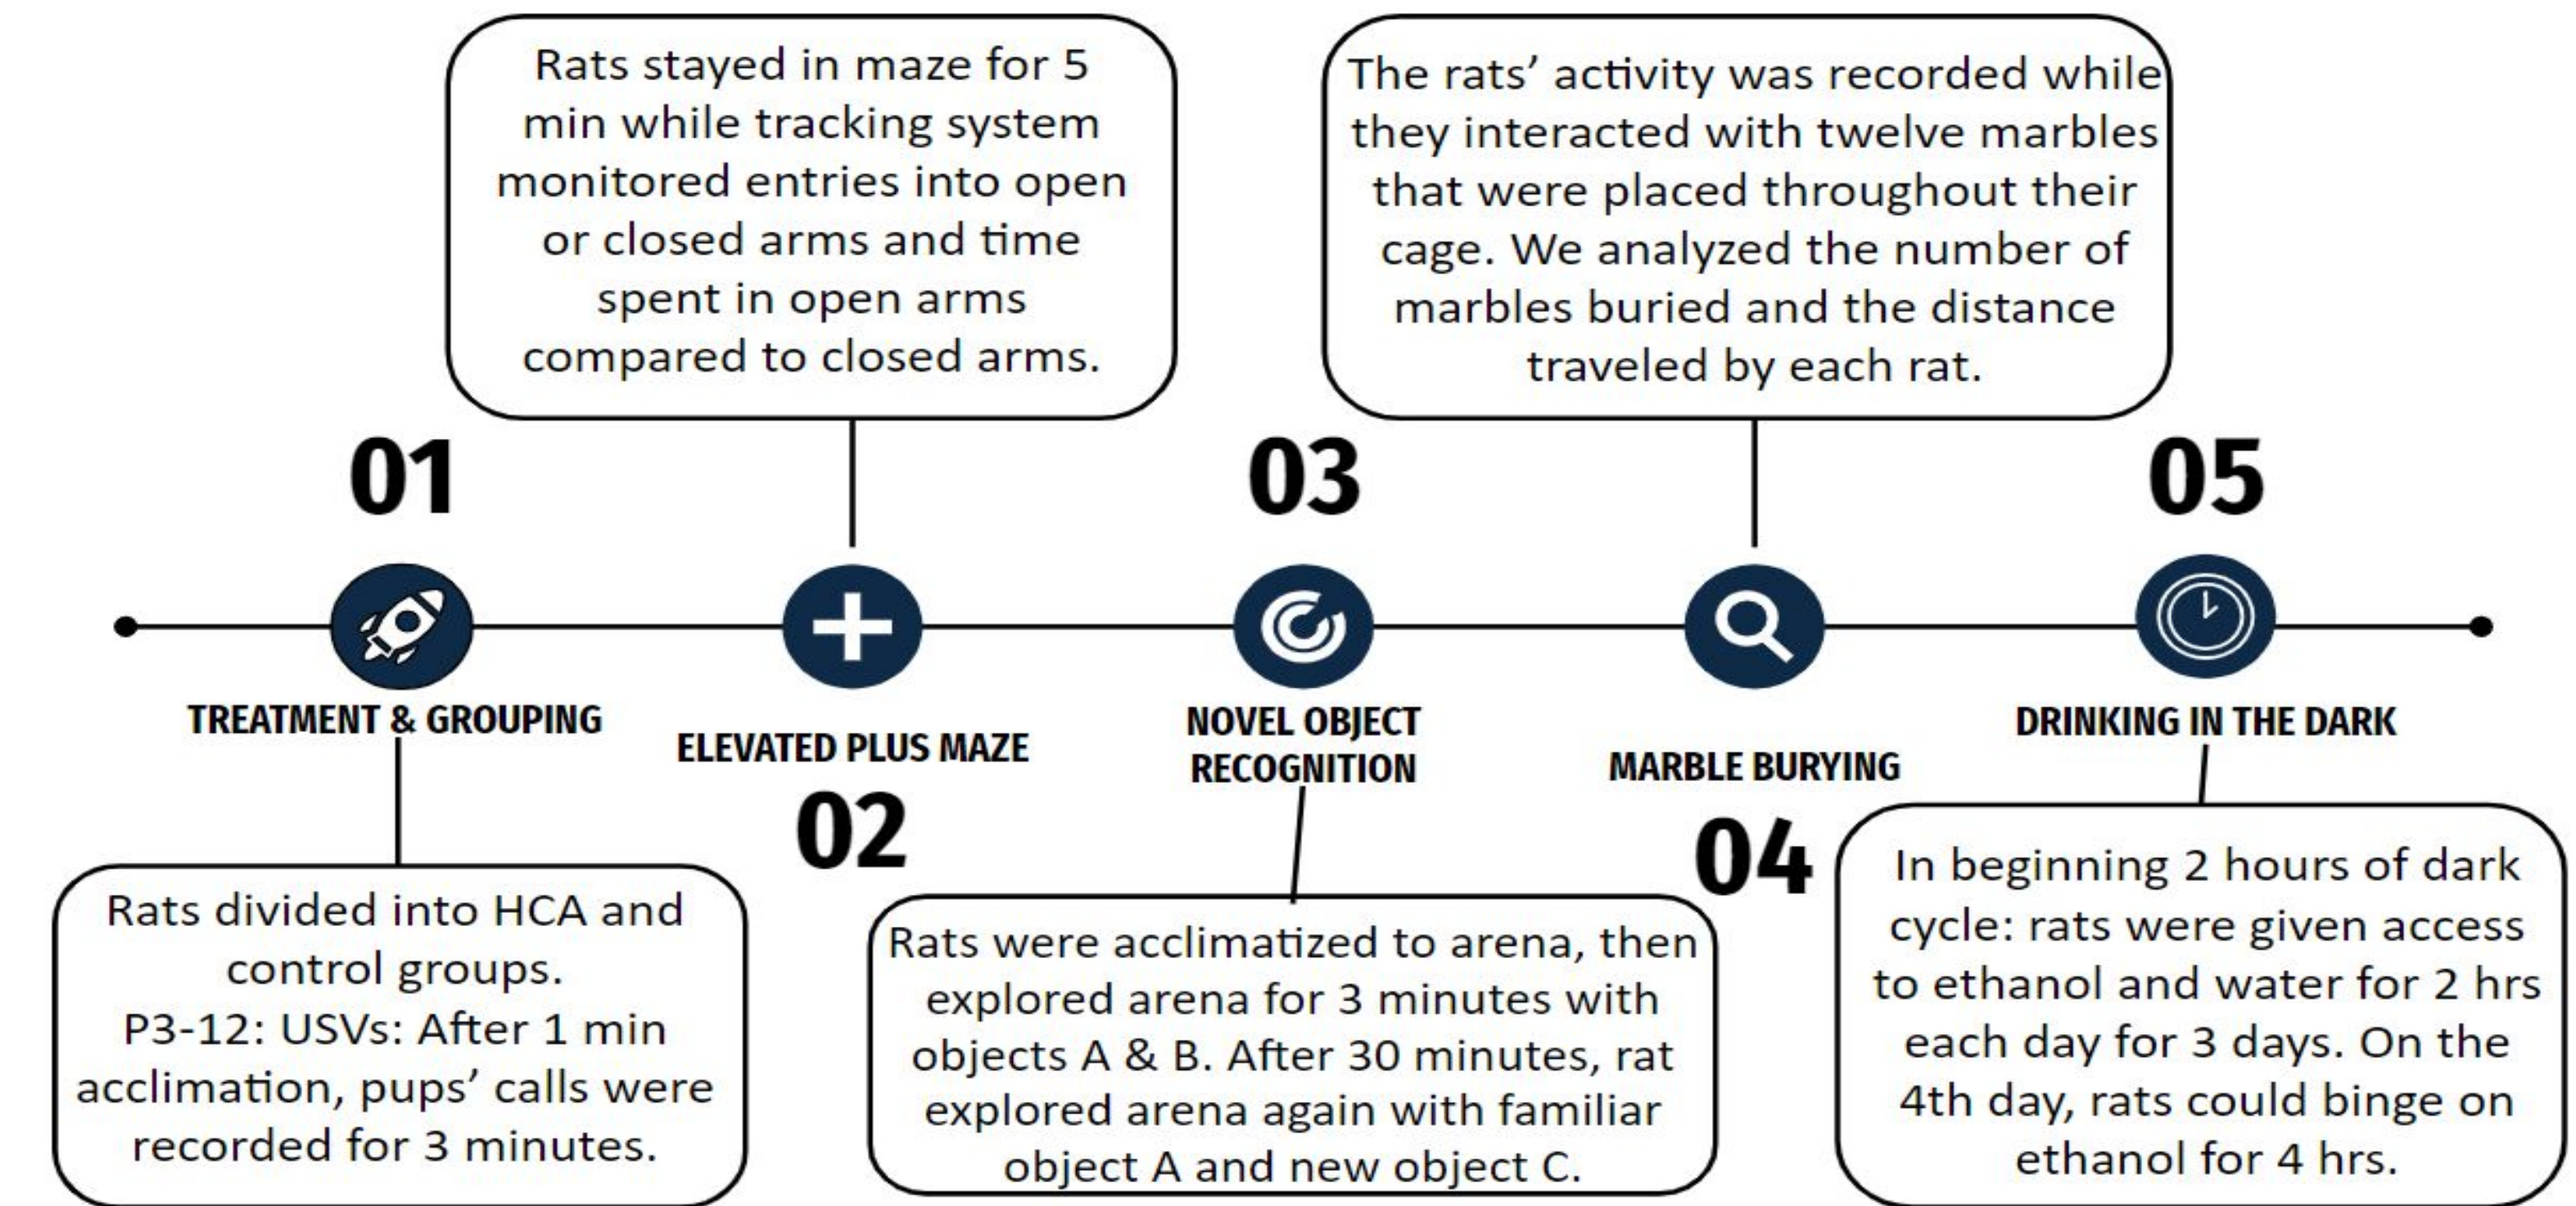

The present study aimed to replicate findings from previous studies of the HCA animal model, while also investigating the effects of HCA on alcohol use, obsessive-compulsive behaviors, and measures of stress in a sex-dependent manner.

This study will allow us to develop a more comprehensive understanding of the ability of the HCA animal model to replicate the complex phenotype of bipolar disorder.

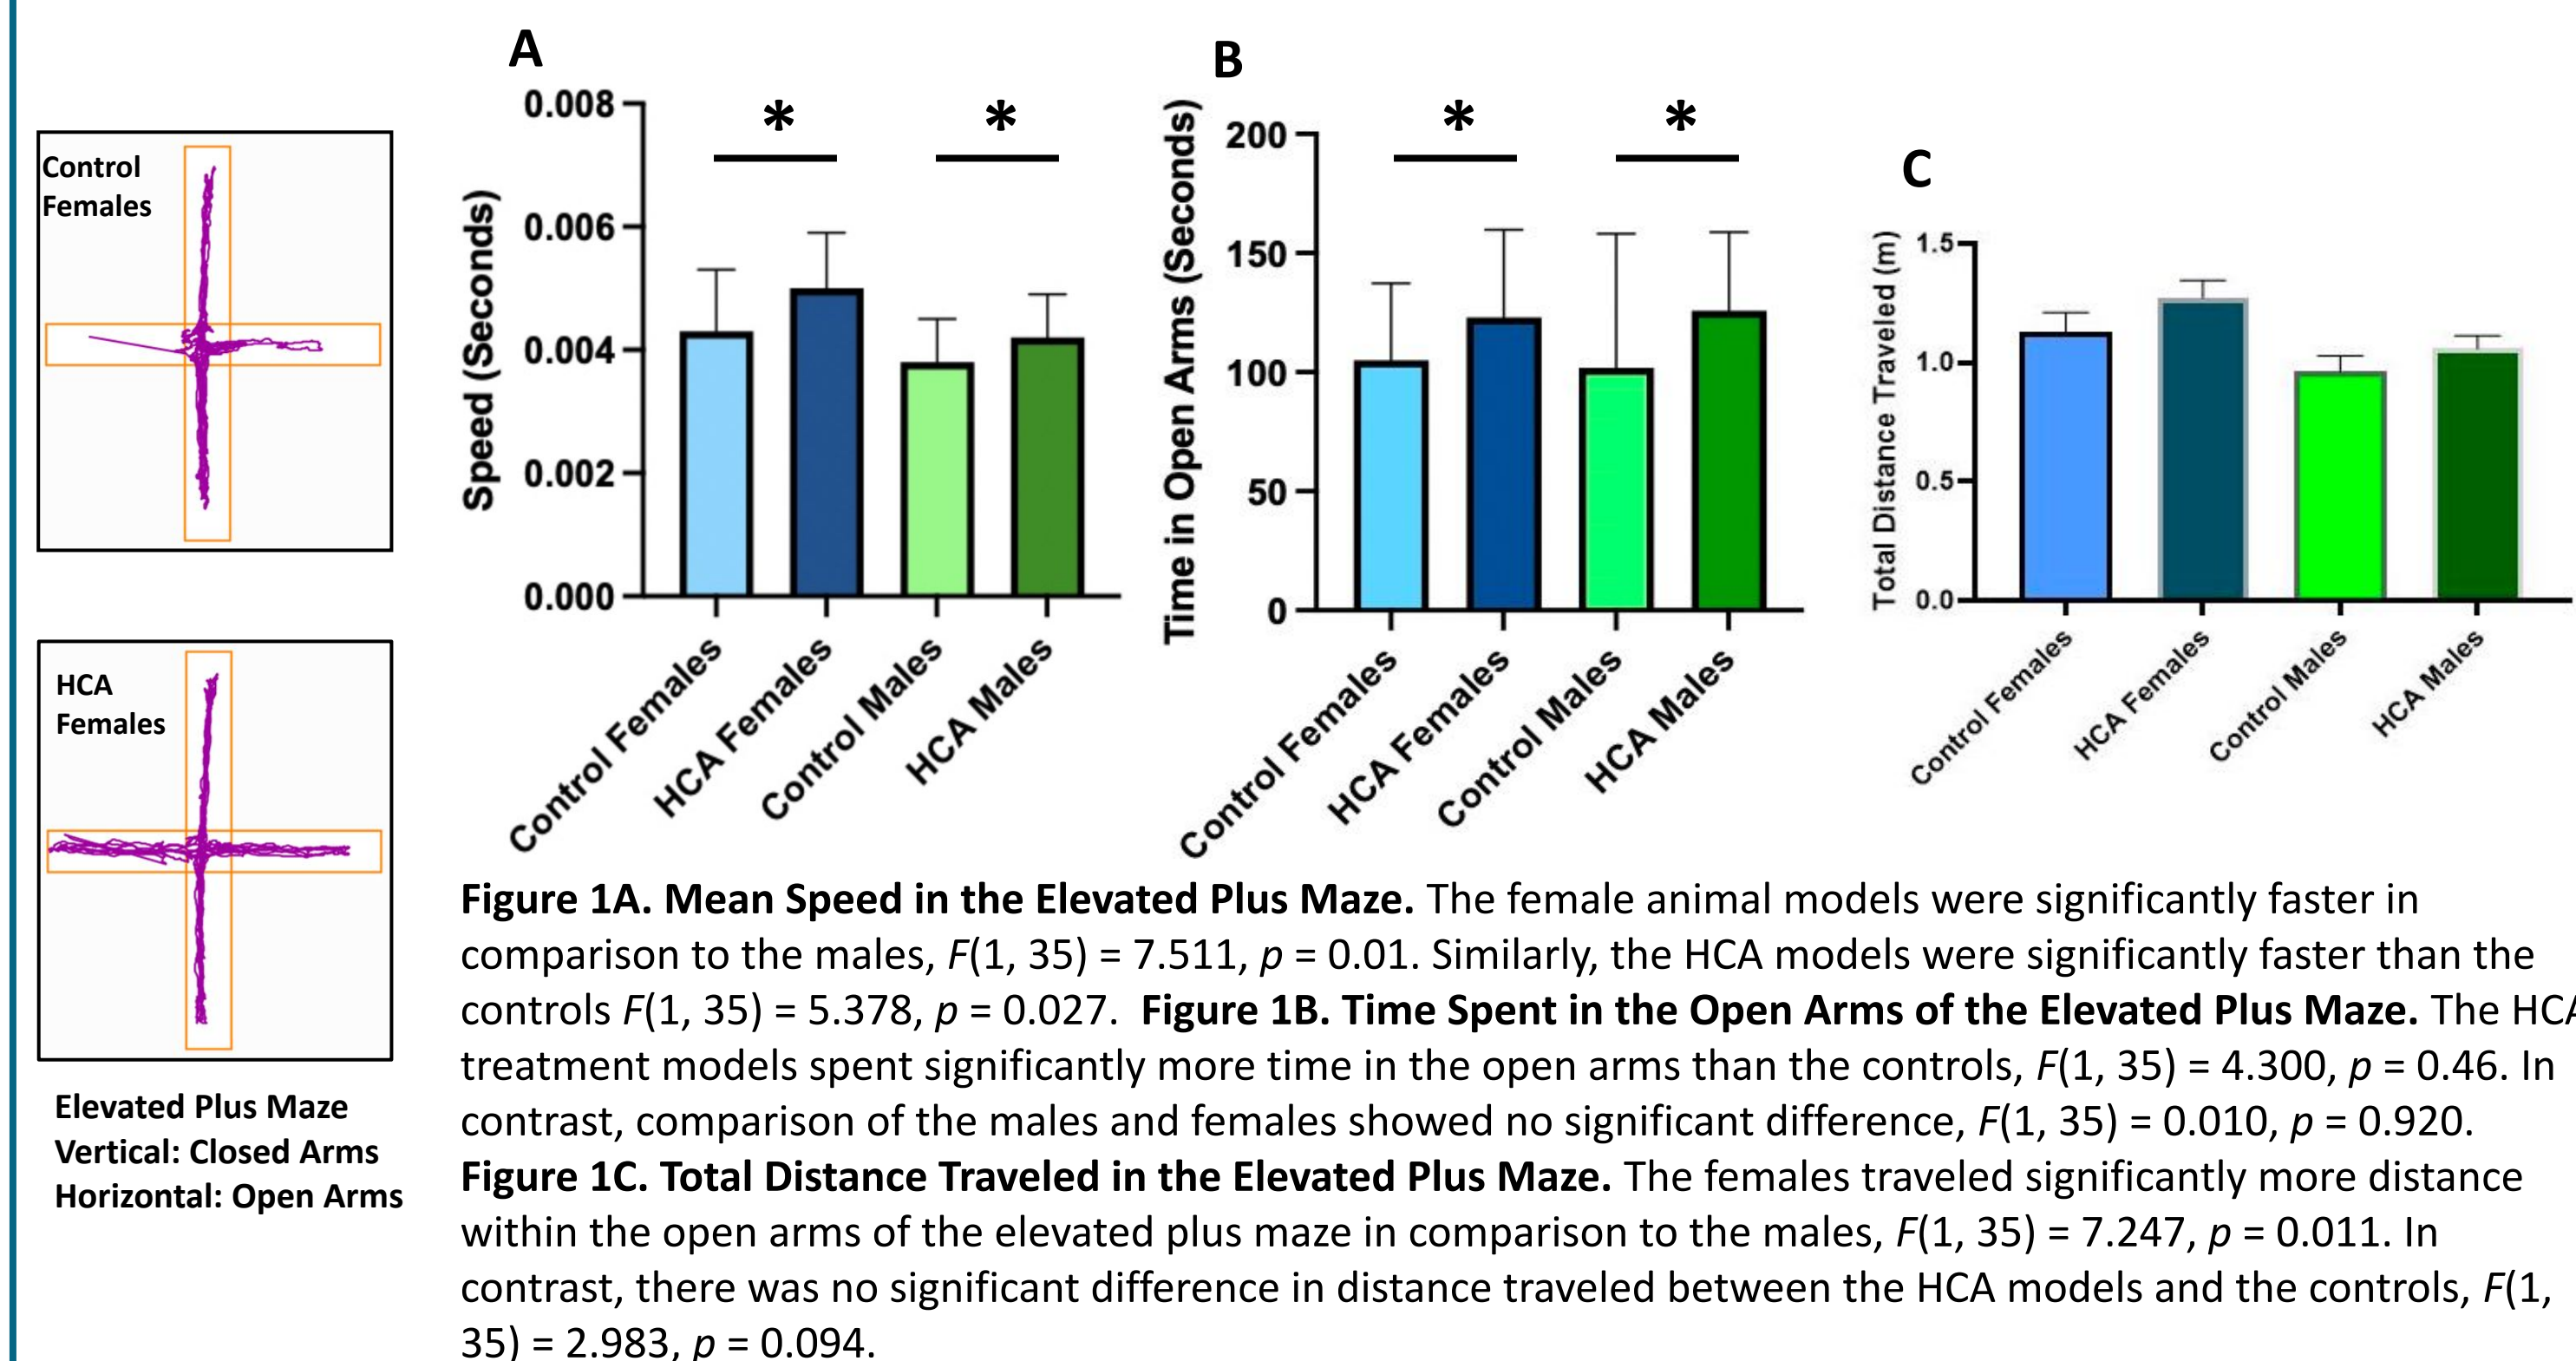

## Summary of Behavioral Assessment

Marble Burying	Repetitive/compulsive behaviors
Ultrasonic Vocalizations	Anxious behaviors
Novel Object Recognition	Memory
Elevated Plus Maze	Risk taking behaviors
Drinking in the Dark	Alcohol use

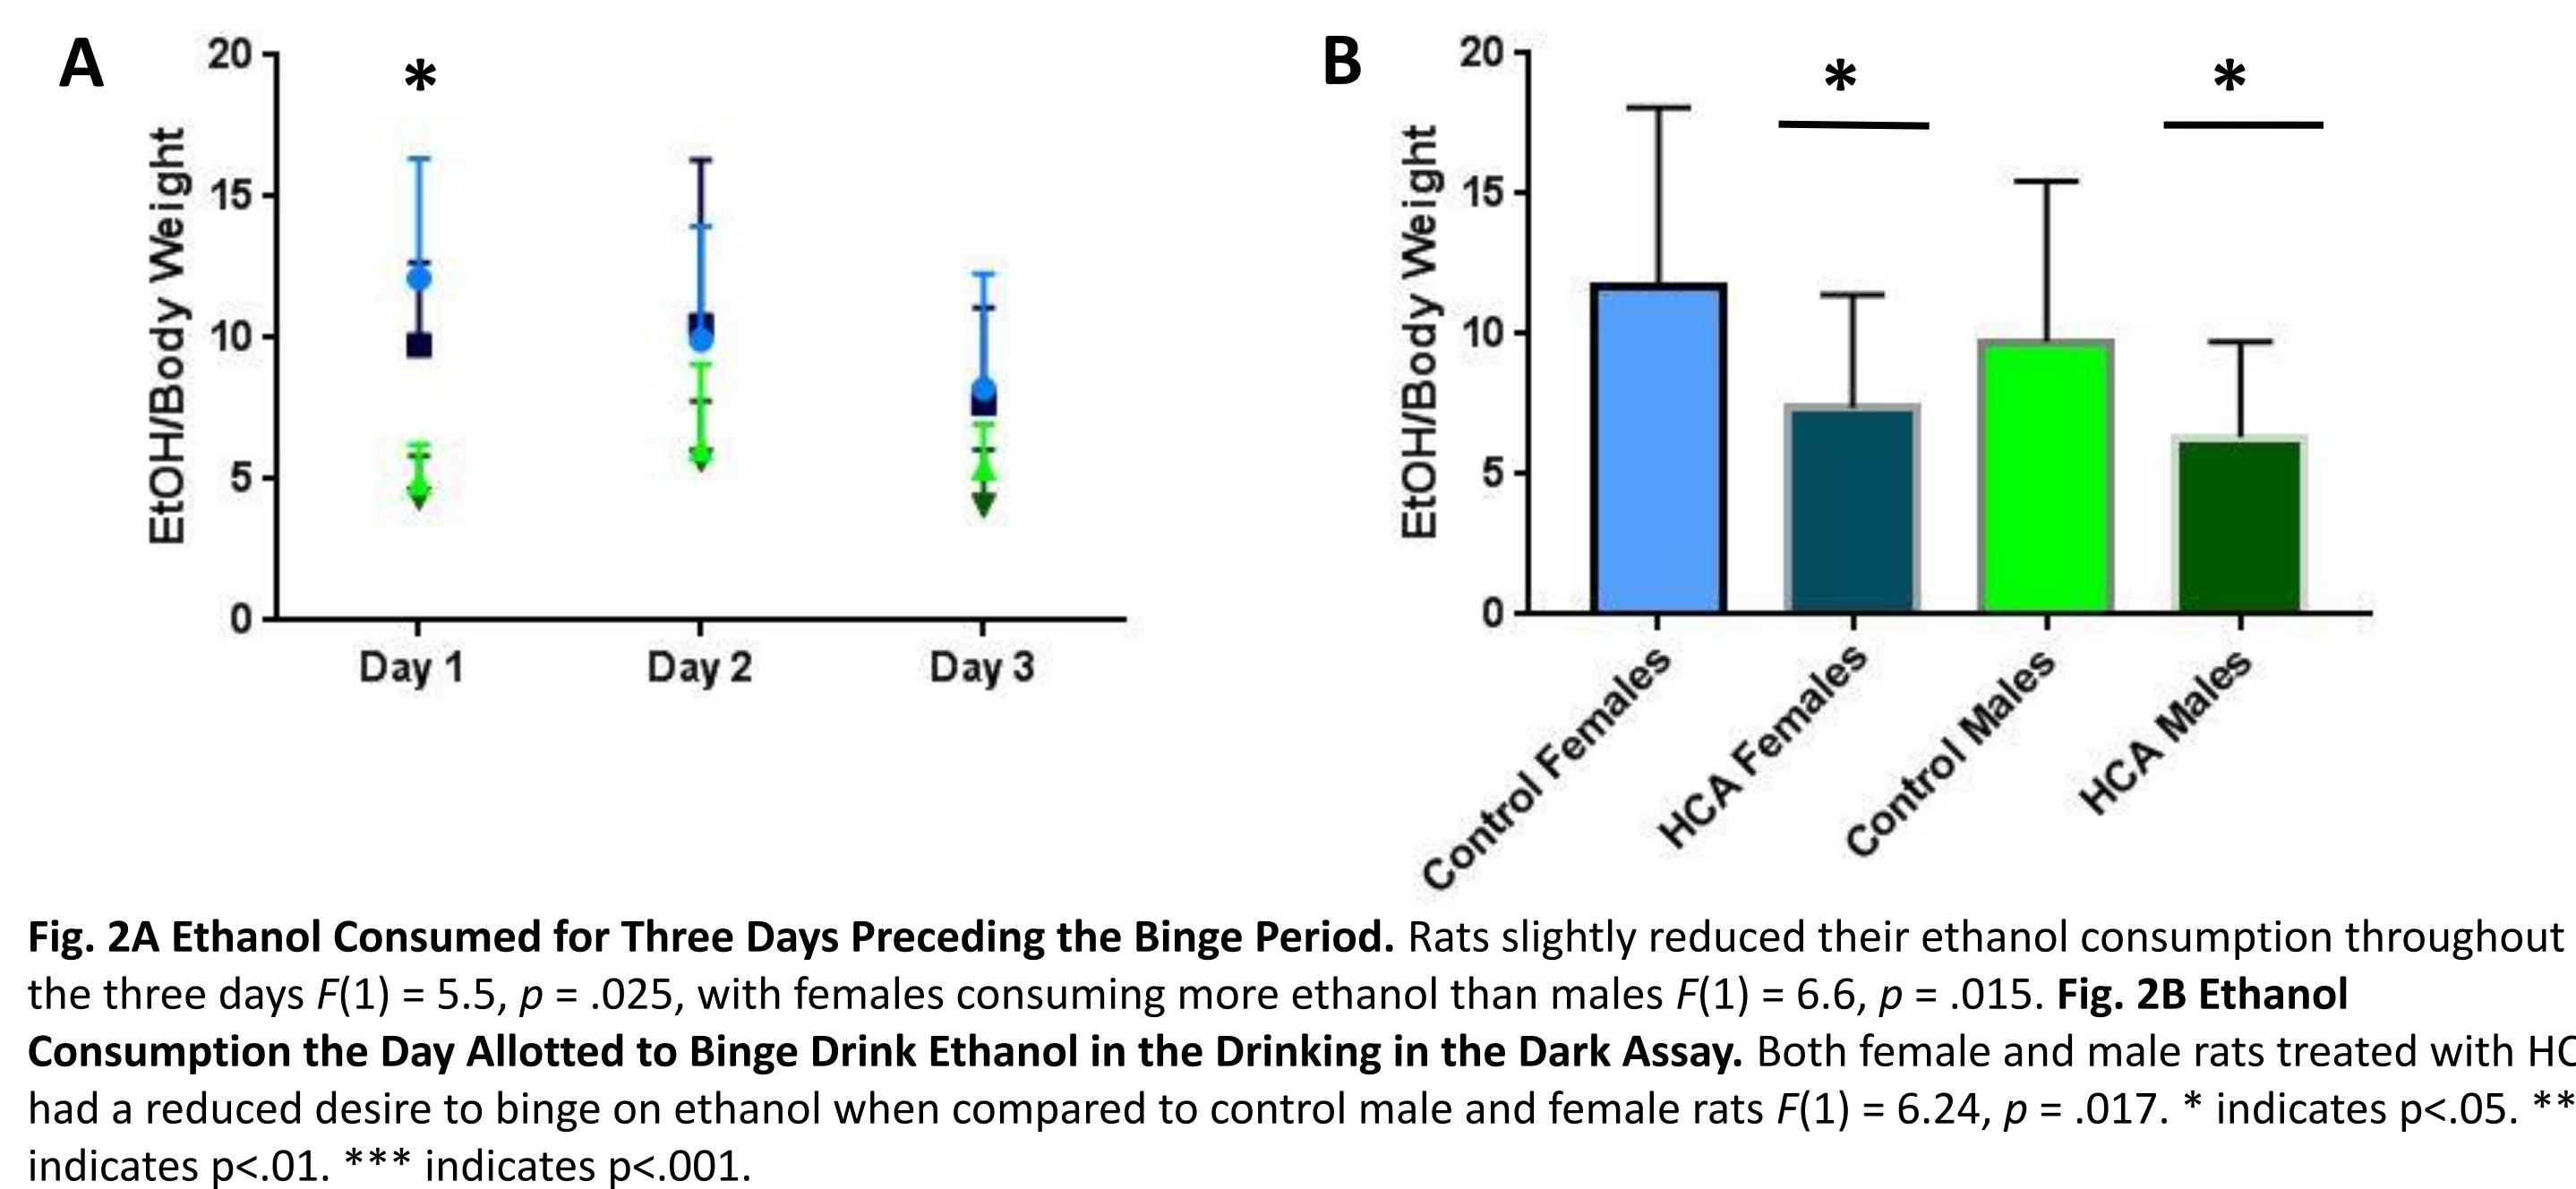

## Methods

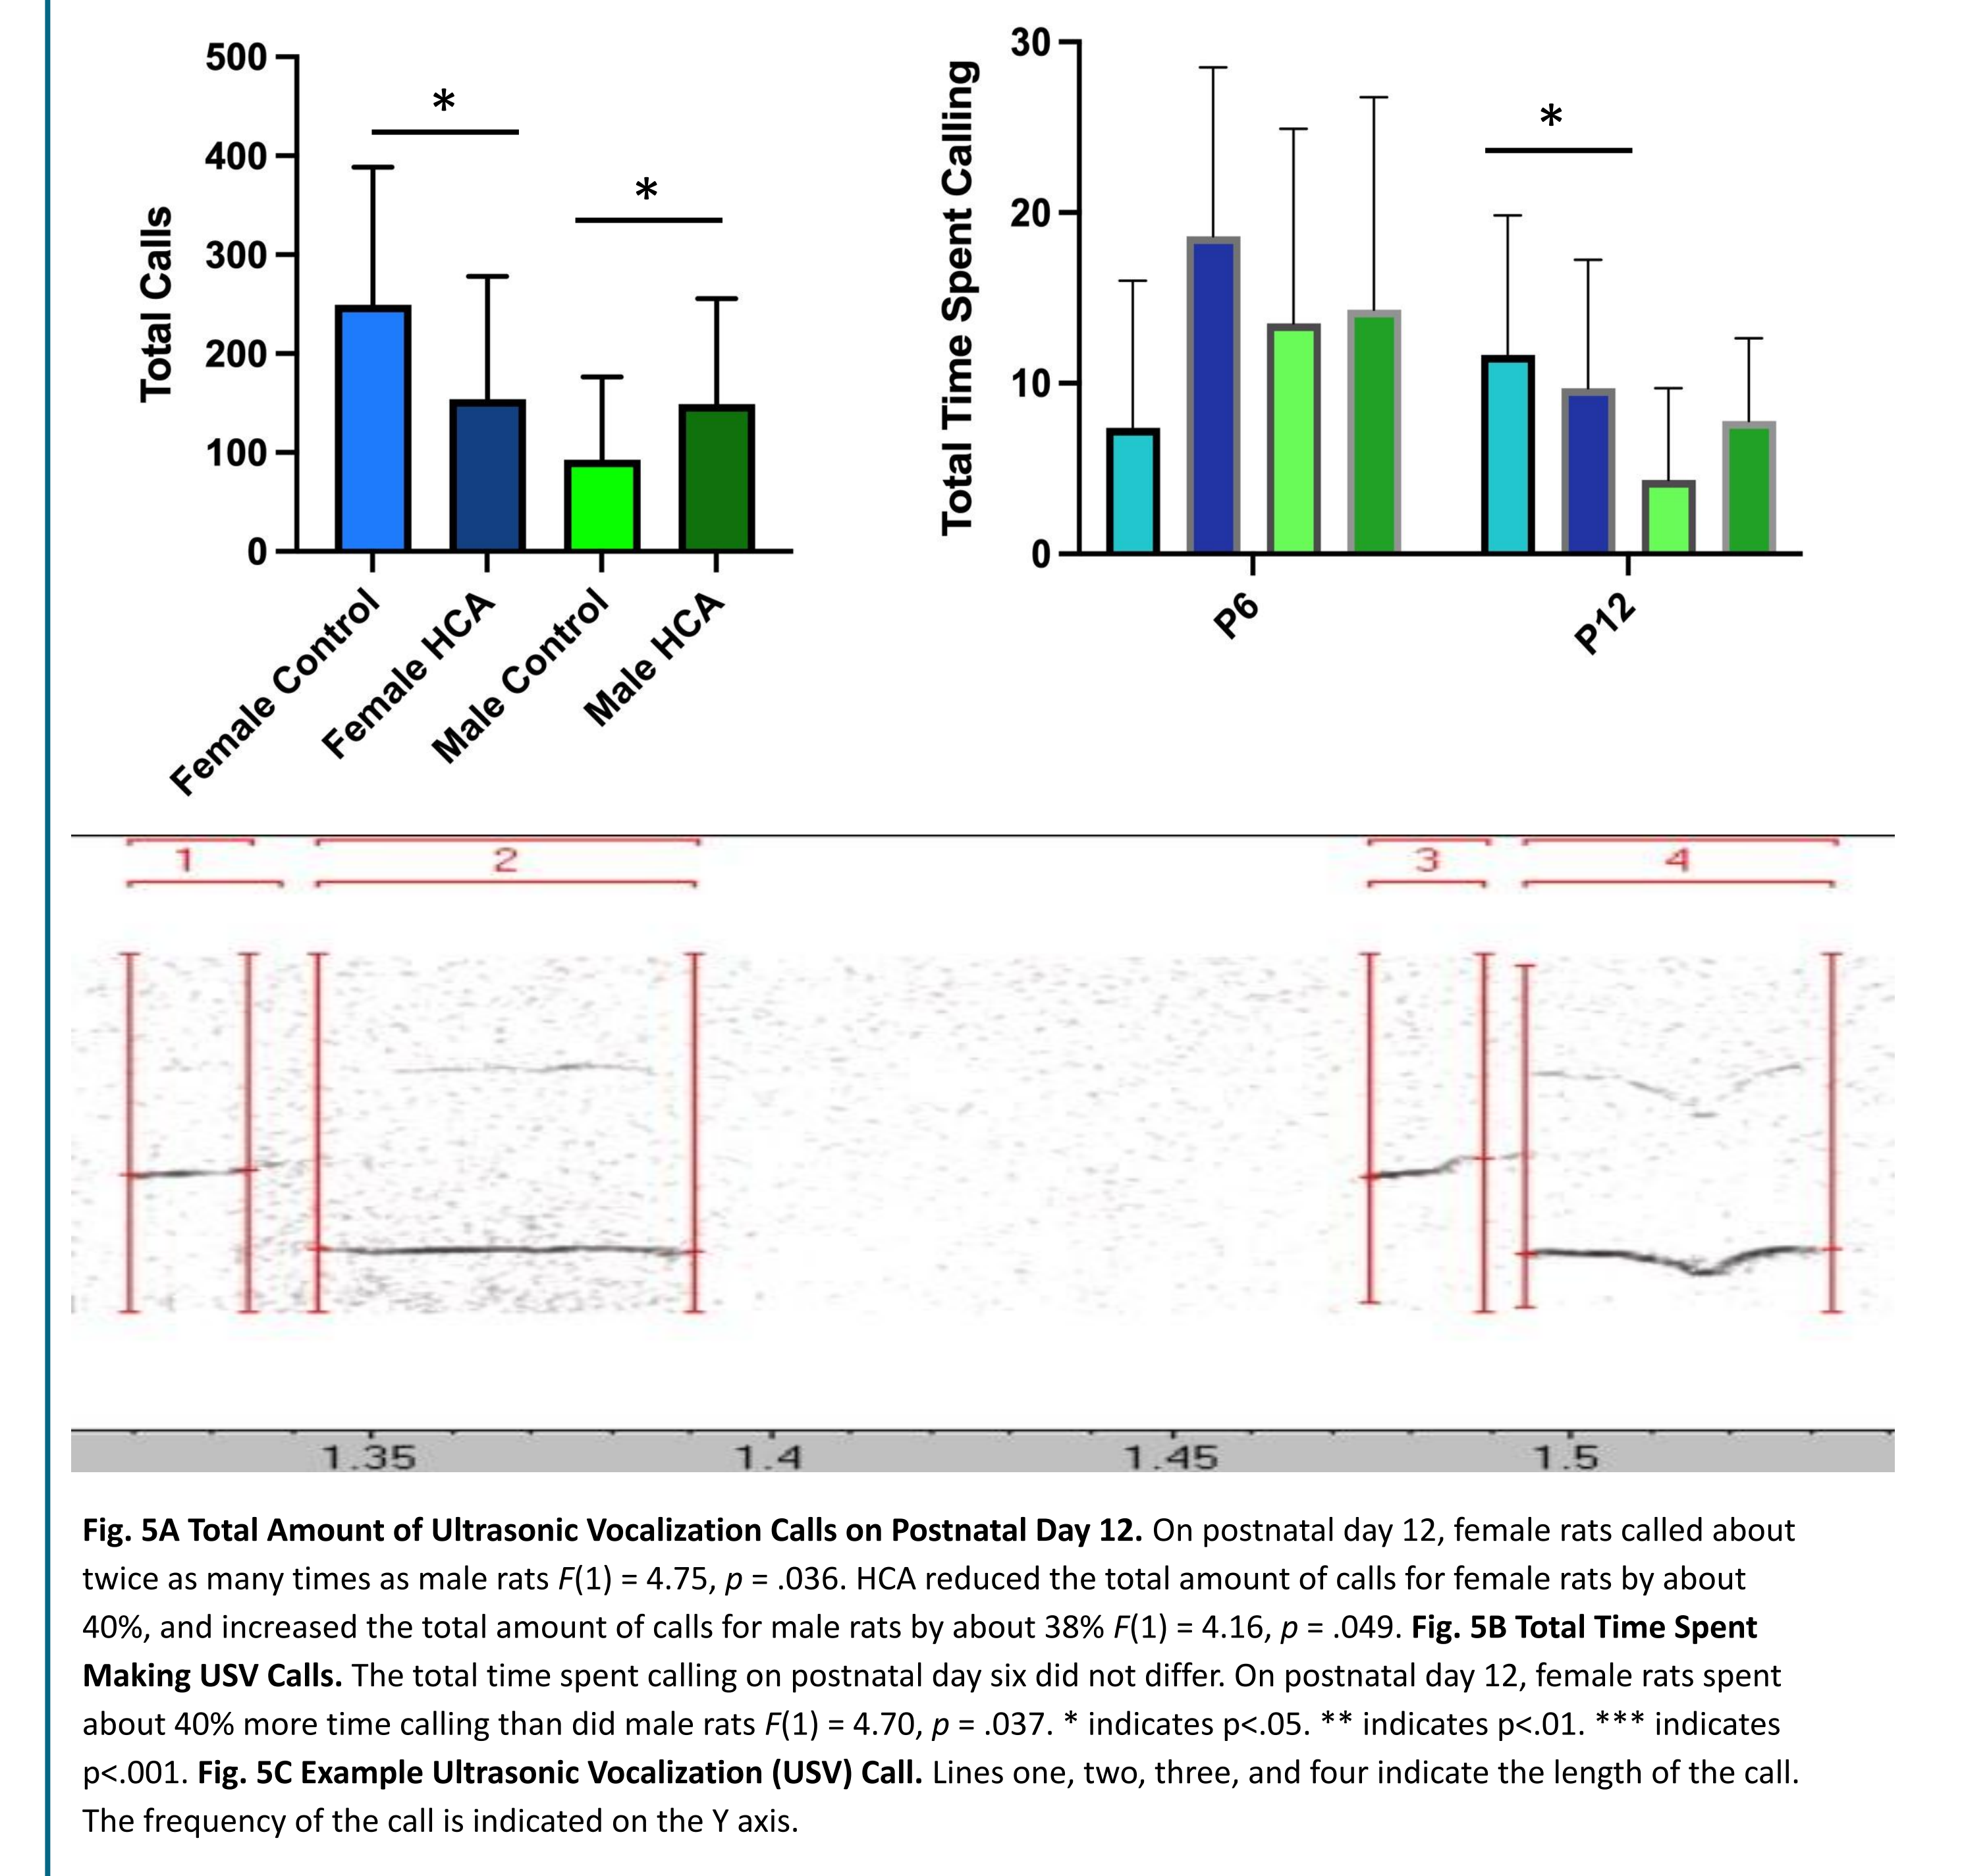

## HCA Induces Manic-Like Behaviors in the Elevated Plus Maze

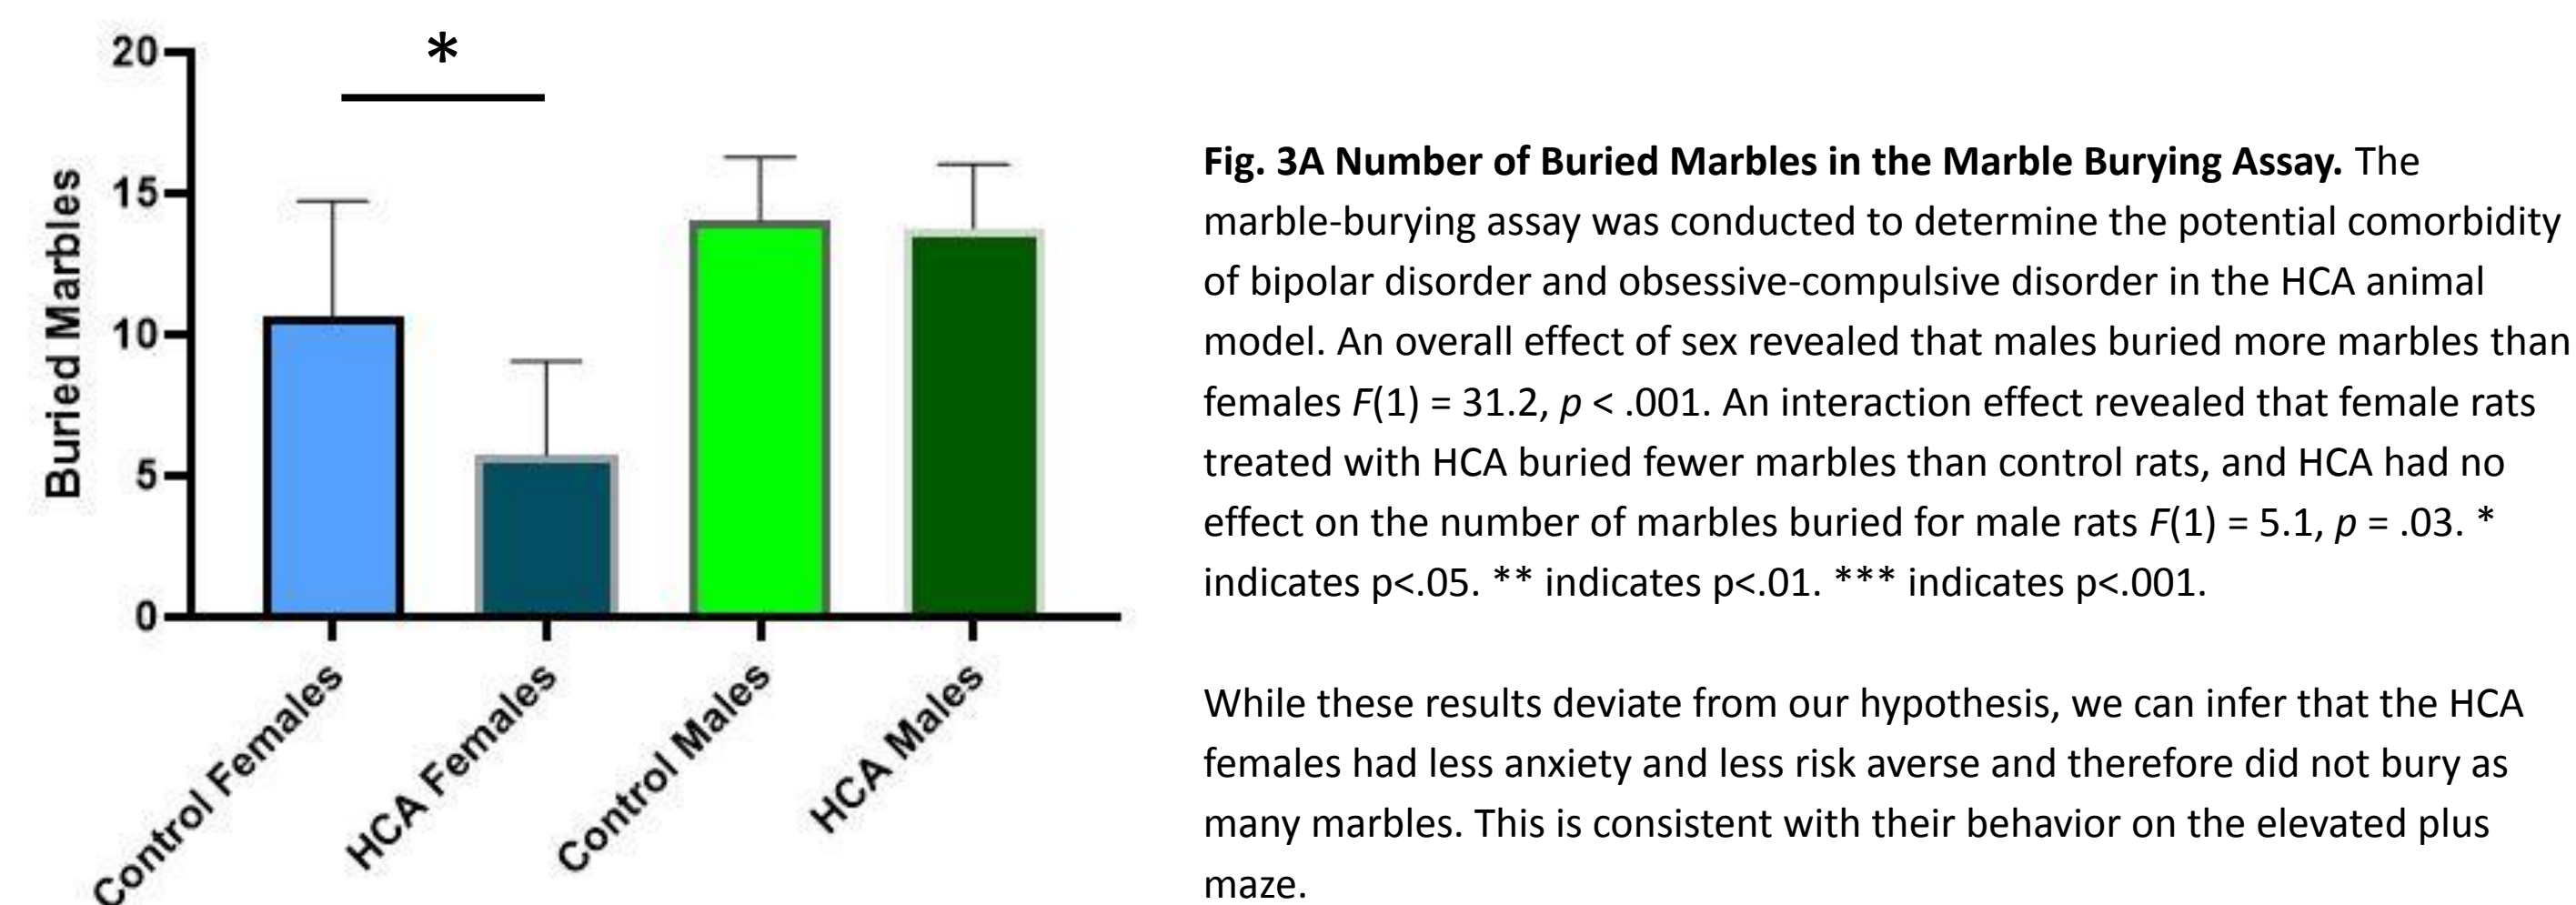

## HCA Did Not Induce EtOH Binge Behavior

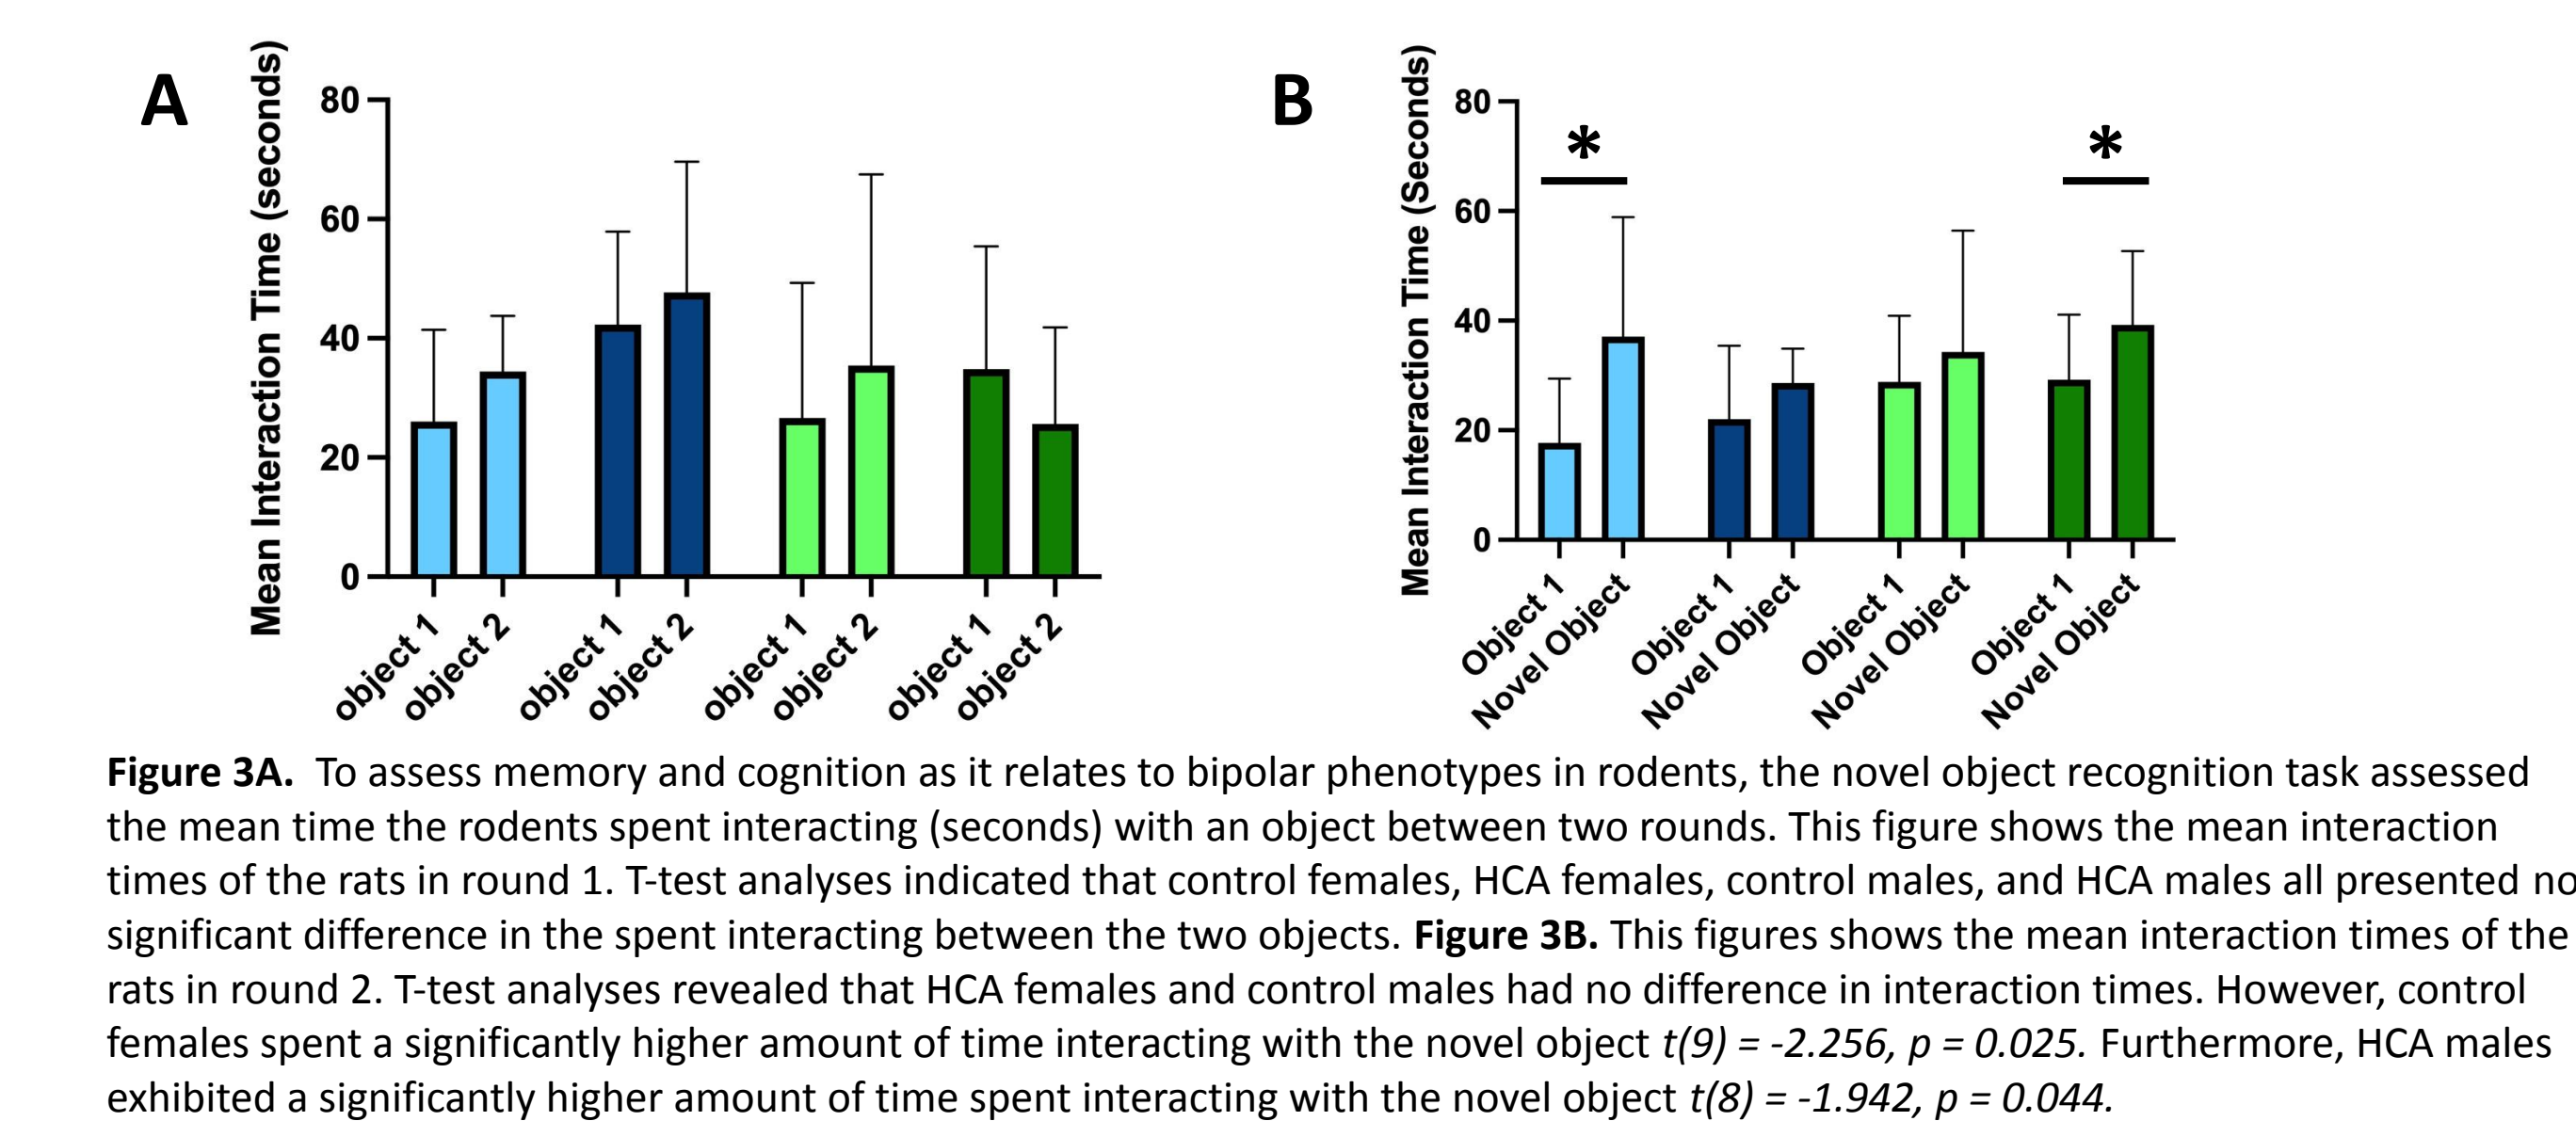

## HCA Reduced USVs in Female Pups and Increased USVs in Male Pups on P12

## HCA Did Not Induce Repetitive OCD Behaviors in Marble Burying

## HCA Decreased Preference for the Novel Object in Females

## Summary of Main Findings

- The HCA model of BD contains valuable face validity for studying manic-like behavior
- HCA impacts males and females differently, much the same way BD can present differently between the sexes.
- As far as comorbidities, the HCA model of BD impacts behavior differently than hypothesized, thereby warranting further research.

## Future Directions

- Further research is warranted in order to continue to understand the relationship between BD and other comorbidities.
- Previous research has implicated stress as an underlying factor in the development and progression of BD.
- In the future, we would like to examine the role that stress plays in the development of BD and its comorbidities.

## Acknowledgements

- Dr. Phil Rivera for consultation on the Drinking in the Dark and Ultrasonic Vocalization experiments
- Dr. Kelly Ronald for the use of her equipment to record the USVs
- Pauliza Kozan for providing guidance on analysis of the USV recordings
- Kim Lane and Emily Kindervater for coordinating animal care
- Hope College animal care workers
- Hope College Neuroscience Program for funding
